

AGRICULTURAL SPRAYERS

High static pressure to push the fertilizer through the nozzles, and resistance to sudden changes in the fan speed are the most important characteristics to keep in mind when you have to choose the right fan for your agricultural sprayer.

Our **TS** and **TM** fans are the ideal solution for your sprayers because they provide high efficiency and reliable performance levels.

In addition to that, HW Ventilation supply centrifugal clutches that are designed for applications like sprayers, in which a gearmotor attached to a fan is directly coupled with the motor shaft and has to start quickly at a high rpm. In these situations, it is recommendable the usage of a clutch that engages the fan gradually, in order to prevent the risk of breakage.
